INT-CL (IPC): A61K 7/50; A61K 7/00; A61K 7/48

ABSTRACT:

PROBLEM TO BE SOLVED: To provide a method of manufacturing a rice-fermented extract for a bathing agent or a cosmetic, having a useful component, especially the one excellent in anti-oxidation characteristics and amino acidity, and especially, capable of properly selecting one or both excellent effects of the antioxidant characteristics and the high amino acidity characteristics by efficiently utilizing red rice bran (the rice bran obtained from the surface side of the rice), rice embryo bud and lees of rice wine, without causing something wrong in the production, such as abnormal fermentation and microorganism contamination.

SOLUTION: This production method comprises a single step or a multistep for carrying out alcohol fermentation of a raw material consisting essentially of rice or white rice bran (the rice bran obtained from the inner side of the rice), and liquefying and saccharifying the raw material, a step succeeding to the before step and for adding one or more kinds of red rice bran, rice embryo bud and lees of rice wine and, and further maturing the added product, and a step for separating the solution extracted therefrom after the preceding step.
